AB To evaluate the methodological issues in using first-visit outpatients as controls in epidemiological studies, the features of general lifestyles of non-cancer outpatients at Aichi Cancer Center Hospital (ACCH) were compared with those of the general population, and their variation by sex, age, and season was determined by using a self-administered questionnaire. The study included 1231 subjects randomly selected from the Nagoya electoral roll (CRG), and three groups of non-cancer ACCH outpatients living in Nagoya; 800 from the period September to December 1992 (OPG1), 2326 from January to December 1992 (OPG2), and 12,243 from January 1991 to December 1992 (OPG3). In the younger age group, the proportion of current smokers was higher in the CRG than in the OPGs. In the older age groups, the proportion of those who consumed fresh vegetables and fruit everyday was higher in the OPGs than in the CRG. For other items, the features of the OPGs were not significantly different from those of the CRG. Among the OPG3, there were differences in the features of general lifestyles between sexes and consumption of several food items varied with age. Seasonal variation, however, was only observed in the specific food items where supply varied seasonally. It was concluded that,

with due consideration of age, sex, and season in the analysis, it is feasible to use non cancer outpatients as controls in epidemiological studies.

AB OBJECTIVE: To investigate the effects of the antiinflammatory cytokines interleukin-4 (IL-4), IL-10, and IL-13 on tumor necrosis factor alpha (TNFalpha)-induced prostaglandin E2 (PGE2) release in the cellular signaling cascade on human osteoarthritis (OA) synovial fibroblasts.
METHODS: Human OA synovial fibroblasts were cultured to explore the impact of IL-4, IL-10, and IL-13 on TNFalpha binding to TNF receptors (TNFR), soluble TNFR (sTNFR), cytoplasmic phospholipase A2 (cPLA2), and cyclooxygenase-2 (COX-2) production, and on the binding activity of the transcription factors nuclear factor kappaB (NF-kappaB), CCAAT-enhancer binding protein (C/EBP), activator protein 2 (AP-2), and cyclic AMP response element-binding protein (CREB). RESULTS: IL-4, IL-10, and IL-13 at 5 ng/ml dramatically reduced TNFalpha-induced PGE2 release by approximately 90% ($P < 0.0001$). IL-4 up-regulated the level of TNFalpha-induced TNFR by 47% ($P < 0.06$), while IL-10 down-regulated it by 71% ($P < 0.02$); IL-13 had no effect. Although statistical significance was not reached, all 3 cytokines up-regulated the basal level of sTNFR-55. IL-4 and IL-10, while not altering the basal level of sTNFR-75, significantly increased the TNFalpha-stimulated release of sTNFR-75. IL-4, IL-10, and IL-13 reduced the TNFalpha-induced COX-2 level, and IL-4 and IL-10 reduced the cPLA2 level. IL-4 had no effect on TNFalpha up-regulation of NF-kappaB, and a slight decrease was noted with IL-10 and IL-13 at the highest concentration used (5 ng/ml). IL-4 and IL-13

decreased the TNFa-induced C/EBP accumulation in a dose-dependent manner, while IL-10 up-regulated its basal level. AP-2 and Oct-3 were not induced by TNFalpha. CONCLUSION: The results indicate that these antiinflammatory cytokines reversed the TNFalpha-induced release of PGE2 by OA synovial fibroblasts, by acting at various levels of the TNFa-dependent signaling cascade. These data shed new light on the mechanisms by which these cytokines reduce inflammatory processes.

ENTRY MONTH: 199608
AB The role for the two tumor necrosis factor (TNF) receptors in discriminating TNF and lymphotoxin alpha (LTalpha) effects has been studied. TNF and LTalpha were equally mitogenic in FS4 fibroblasts, which express a high amount of the p55 compared to the p75 TNF receptors (TNFRs). In contrast, TNF was more potent than LTalpha in mediating gene regulation and cytotoxicity in SW480-betaGal cells and KYM-1 cells, which have a high p75/p55 TNFR ratio. Both TNF and LTalpha showed comparable affinities for the two TNFRs. However, in contrast to LTalpha, TNF dissociated rapidly from the p75 TNFR, whereas both cytokines dissociated slowly from the p55 TNFR. Soluble p55 TNFR was much more potent than soluble p75 TNFR in inhibiting TNF cytotoxicity, whereas both soluble receptors moderately decreased LTalpha-mediated cytotoxicity with comparable efficacy. Antagonistic monoclonal antibodies against either TNFR types markedly inhibited TNF effects. However, only the p55 TNFR antagonistic antibody significantly decreased LTalpha-mediated cytotoxicity and cytomegalovirus promoter activation, whereas blocking of the p75 TNFR enhanced the LTalpha effects. These data suggest that whereas the p75 TNFR can both directly propagate TNF signals and "pass" TNF to the p55 TNFR, it attenuates LTalpha and may serve as a decoy receptor for this cytokine.

AB **Fas** (CD95) and **Fas** ligand (**FasL**) are a receptor/ligand pair critically involved in lymphocyte homeostasis and peripheral tolerance such that genetic defect in either **Fas** or **FasL** results in an autoimmune lymphoproliferative syndrome. **Fas** is a type I transmembrane protein and a member of the tumor necrosis factor receptor (**TNFR**) family whereas **FasL** is a type II transmembrane protein and a member of TNF family. Binding of **Fas** by **FasL** induces apoptosis of the **Fas**-expressing cells. In the past few years, **Fas/FasL** interaction has been connected to a series of important phenomena previously viewed as independent immune processes. The activation-induced T cell death (AICD) and the **FasL**-mediated cytotoxicity by activated T cells are two critical mechanisms that can account for most of these phenomena. It is in the context of the two mechanisms that we discuss in this **review** the molecular and cellular events that occur during T/T and T/B interactions that account for the down-regulation of the immune response. We have also discussed recent advances in the areas of **FasL** gene regulation, lymphokine regulation of AICD, and regulation of B cell susceptibility to **FasL**. Investigation in these areas should help elucidate the role of **Fas/FasL** in the complex network of regulatory mechanisms that control immune response and autoimmunity.

SUMMARY LANGUAGE: English
AN 1995:25179481 BIOTECHNO
AB The TNF receptor superfamily members are all type I membrane glycoproteins with typical homology in the extracellular domain of

variable numbers of cysteine-rich repeats (overall homologies, 25% to 30%). In contrast, the TNF ligand superfamily members (with the exception of LT.alpha.) are type II membrane glycoproteins with homology to TNF in the extracellular domain (overall homologies, 20%). TNF and LT.alpha. are

trimeric proteins and are composed of .beta.-strands forming a .beta.-jellyroll. The homology of the .beta.-strand regions for the TNF ligand superfamily members suggest a similar .beta.-sandwich structure and possible trimeric or multimeric complex formation for most or all members. A genetic linkage, as evidence for evolutionary relatedness, is found by chromosomal cluster of **TNFR** p80, CD30, 4-1BB, and OX40 for 1p36; **TNFR** p60, **TNFR-RP**, and CD27 for 12p13; TNF, LT.alpha., and LT.beta. for 6 (MHC locus); CD27L and 4-1BBL for 19p13; and **FASL** and OX40L for 1q25. Of the TNF ligand superfamily, TNF, LT.alpha., and LT.alpha. and their receptors (**TNFR** p60, **TNFR** p80, and **TNFR-RP**) interact in a complex fashion of cross-binding. However, the other family members presently have a one ligand/one receptor binding principle (CD27/CD27L, CD30/CD30L, CD40/CD40L, 4-1BB/4-1BBL, OX40/gp34, and **FAS/FASL**).

In general, the members of the TNF ligand superfamily mediate interaction

between different hematopoietic cells, such as T cell/B cell, T cell/monocyte, and T cell/T cell. Signals can be transduced not only through the receptors but also through at least some of the ligands. The transduced signals can be stimulatory or inhibitory depending on the target cell or the activation state. Taken together, TNF superfamily ligands show for the immune response an involvement in the induction of cytokine secretion and the upregulation of adhesion molecules, activation

antigens, and costimulatory proteins, all known to amplify stimulatory and regulatory signals. On the other hand, differences in the distribution, kinetics of induction, and requirements for induction support a defined role for each of the ligands for T-cell-mediated immune

responses. The shedding of members of the TNF receptor superfamily could limit the signals mediated by the corresponding ligands as a functional regulatory mechanism. Induction of cytotoxic cell death, observed for TNF, LT.alpha., CD30L, CD95L and 4-1BBL, is another common functional feature of this cytokine family. Further studies have to identify unique versus redundant biologic and physiologic functions for each of the TNF superfamily ligands. Primary H-RS cells can express TNF, LT.alpha., and CD27L but not CD30L and CD40L, in addition to IL-1.alpha., IL-5, IL-6, IL-9, and M-CSF. In addition, H-RS cells express high copy numbers of several cytokine receptors such as IL-2R (p55, p75, and p64 subunits), IL-6R, M-CSFR (c-fms), SCFR (c-kit), CD30, CD40, and TNFRs. Cytokines produced by H-RS cells might support the growth of tuftsin cells (autocrine growth loop) and/or interact with surrounding reactive bystander cells, particularly T cells. Conversely, H-RS cells might respond to cytokines produced by surrounding reactive normal cells (paracrine growth loop). The different interactions between H-RS cells and surrounding normal, reactive bystander cells, such as lymphocytes, plasma cells, histiocytes, neutrophils, eosinophils, and stromal cells, is characteristic for HD. The expression and biologic effects of a panel of cytokines and their counterpart receptors seem to be involved in the pathobiologic interaction between H-RS cells and particularly lymphocytes, mainly CD4.sup.+ T cells. Detailed analyses have to verify the predicted biologic activities of TNF, LT.alpha., CD27L, CD30L.

CD40L,

4-1BBL, gp34/OX40L, and **FASL** for the H-RS cell/T-cell interactions with impact on tumor growth and pathogenesis of HD. Cytokines and cytokine receptors, including TNF/TNFRs, CD30/CD30L, and CD40/CD40L, are clearly critical elements in the pathology of HD and are part of the deregulated network of interactive signals between H-RS cells and surrounding bystander cells with membrane associated and cytokine mediated events. HD is a tumor of cytokine-producing cells that is causative for several characteristic clinical and pathologic presentation of HD. The functional role of cytokines for the pathogenesis

of NHLs is present, unclear. Malignant NHL cells express, depending on their immunophenotype, several TNF receptor and ligand superfamily members. B-cell NHLs are frequently CD27/CD27L, CD30 or CD30L, CD40, and TNFRs/TNF positive, but T-cell NHLs have expression of CD30, CD40L, and TNFRs/TNF.

'L-6' IS NOT A VALID FORMAT FOR FILE 'REGISTRY'
```

The following are valid formats:

Substance information can be displayed by requesting individual fields or predefined formats. The predefined substance formats are: (RN = CAS Registry Number)

REG	- RN
SAM	- Index Name, MF, and structure - no RN
FIDE	- All substance data, except sequence data
IDE	- FIDE, but only 50 names
SQIDE	- IDE, plus sequence data
SQIDE3	- Same as SQIDE, but 3-letter amino acid codes are used
SQD	- Protein sequence data, includes RN
SQD3	- Same as SQD, but 3-letter amino acid codes are used
SQN	- Protein sequence name information, includes RN

Any CA File format may be combined with any substance format to obtain CA references citing the substance. The substance formats must be cited first. The CA File predefined formats are:

ABS	-- Abstract
APPS	-- Application and Priority Information
BIB	-- CA Accession Number, plus Bibliographic Data
CAN	-- CA Accession Number
CBIB	-- CA Accession Number, plus Bibliographic Data (compressed)
IND	-- Index Data
IPC	-- International Patent Classification
PATS	-- PI, SO
STD	-- BIB, IPC, and NCL
IABS	--ABS, indented, with text labels
IBIB	-- BIB, indented, with text labels
ISTD	-- STD format, indented

OBIB ----- AN, plus bibliographic Data (original)
OIBIB ----- OBIB, indicated with text labels

SBIB ----- BIB, no citations
SIBIB ----- IBIB, no citations

The ALL format gives FIDE BIB ABS IND RE, plus sequence data when it is available.

The MAX format is the same as ALL.

The IALL format is the same as ALL with BIB ABS and IND indented, with text labels.

For additional information, please consult the following help messages:

HELP DFIELDS -- To see a complete list of individual display fields.

HELP FORMATS -- To see detailed descriptions of the predefined formats.

ENTER DISPLAY FORMAT (IDE):sqn

FILE COVERS 1967 - 9 Jun 2000 VOL 132 ISS 24
FILE LAST UPDATED: 8 Jun 2000 (20000608/ED)

This file contains CAS Registry Numbers for easy and accurate substance identification.

This file supports REG1stRY for direct browsing and searching of all substance data from the REGISTRY file. Enter HELP FIRST for more information.

Now you can extend your author, patent assignee, patent information, and title searches back to 1907. The records from 1907-1966 now have this searchable data in CAOLD. You now have electronic access to all of CA: 1907 to 1966 in CAOLD and 1967 to the present in CAPLUS on STN.
